## FOREWORD

It gives me immense pleasure that Hydromet Division of India Meteorological Department (IMD) has prepared ‘Rainfall Statistics of India – 2018’.

Realtime monitoring of rainfall is a very important activity of IMD. The rainfall products at different temporal and spatial scales are very useful for the Policy Makers, Agriculturists, Planners, Research Scholars, Flood Forecasters and many more. The report contains the detailed rainfall information in the daily, weekly, monthly, seasonal and annual scale for the districts, states, met sub divisions, four homogeneous regions and for the country. The rainfall statistics and various derived products are available in the form of tables, graphs and maps in a user-friendly format.

This technical publication is an outcome of sincere efforts of all the team members of Hydromet Division, IMD. I take this opportunity to express my sincere appreciation to DGM-IMD and the whole team for putting their best efforts in bringing out this publication.

## Foreword

Rainfall is the primary source of water and is of great importance for India's Economy, specially in agriculture sector. It is highly variable over space and time, leads to flood and drought every year in one or the other part of the country. Rainfall statistics is therefore required by the Policy Makers, Planners, Design Structure Engineers, Agriculturists, Hydrologists, Research Scholars and many more for proper management of water resources and its efficient use. Keeping in view the usefulness of rainfall statistics, the publication of rainfall statistics on annual basis was started 2012 onwards.

It gives me immense pleasure to present the 'Rainfall Statistics of India – 2018' based on the rainfall received during the year and its comparison with normal rainfall based on the rainfall records for the period from 1951-2000.

I appreciate the authors for their painstaking efforts in bringing out this publication.

(DR. M. MOHAPATRA)

## **Preface**

India Meteorological Department is using the rainfall data received from a network of more than 3700 rain-gauge stations which are under District wise Rainfall Monitoring Scheme (DRMS) on real time and prepares the rainfall statistics, both in tabular as well as in map/graphical form. The statistics is prepared for the administrative zones like districts, states and for the country. The statistics is also prepared for the 36 Meteorological Subdivisions and for the four broad regions (North West India, Central India, South Peninsula and, North & North East) of India. The rainfall is prepared at various temporal scales viz., weekly, monthly, seasonal and annual basis. Besides this, the hydromet division of IMD also monitors the Meteorological Subdivisional rainfall on daily basis during the Southwest Monsoon season for the whole country and during Northeast Monsoon (Post-Monsoon) season for South Peninsula Region. Although, the current real-time rainfall products are uploaded on IMD website at <http://hydro.imd.gov.in/hydrometweb/>, updated statistics is in most demand by various users as it is included additional late receiving station's data in updating the statistics. Hope, this publication containing updated rainfall statistics for the year 2018 would be useful for the various stakeholders.

We are thankful to P. K. Gupta, Rameshwar Ram, Smt. Malini Thakur, P.K. Panchal, Manvir Singh, Davinder Sharma, Smt. Sushma Singh, Ashok Kumar and Deepak Yadav of Hydromet Division, New Delhi for their whole-hearted contribution in bringing out this publication.

## INTRODUCTION

Rainfall is highly variable in time and space. Over 75% of the annual rainfall is received in the four rainy months for June to September only thereby leading to large variations on temporal scale. The average annual rainfall is 119 cm, but it has great spatial variations. The areas on the Western Ghats and the Sub-Himalayan areas in North East and Meghalaya Hills receive heavy rainfall of over 250 cm annually, whereas the Areas of Northern parts of Kashmir and Western Rajasthan receive rainfall less than 40 cm. The spatial distribution of annual normal rainfall and the network using which the normal rainfall was computed have been depicted in Figure 1(a) and Figure 1(b) respectively. Rainfall Normals have been computed using rainfall records of 50 years (1951-2000) of a network of 2412 stations all over the India. The two significant features of India's rainfall is that, in the north India, rainfall decreases westwards and in the Peninsular India, it decreases eastwards and then increases in the coastal region.

## METHODOLOGY

The rainfall statistics is computed based on the receipt of rainfall data from about 3500 stations spread over the entire country. Based on daily rainfall data of these stations, the rainfall of all the districts are computed and using the rainfall of the districts, rainfall statistics for the Meteorological (Met.) Subdivisions, states, the four broad regions and for the whole country have been computed. The present publication includes the updated rainfall statistics for the country as a whole, for all the four broad regions of India, 36 Met.Subdivisions, all States and UTs and 681 Districts of India. The statistics is provided on monthly, 4 seasons i.e. Winter (Jan-Feb), Pre-Monsoon (Mar-May), Southwest (SW) Monsoon (Jun-Sep) and Post-Monsoon (Oct-Dec), and on annual basis. The Rainfall Normals used in this report are based on the rainfall records for the period from 1951-2000. Percent departure of rainfall from Rainfall Normals, besides these statistics, have been color coded as per their categories. The list of categories, their corresponding ranges and color codes is given in Table 1.

## **SEASONAL & ANNUAL RAINFALL STATISTICS FOR THE COUNTRY & BROAD REGIONS**

The country received annual rainfall of 86% (102.08cm) of its normal rainfall of 118.7 cm and during SW monsoon season, 91% (80.41 cm) of its normal rainfall of 89 cm. The region-wise and the country's seasonal and annual actual observed rainfall are given at Table 2, and the percentage departure from normal rainfall are given at Table 3. It may be observed that four homogeneous regions as well as the country as a whole received negative % departure of rainfall during all the seasons and also annually except south peninsula it is positive % departure during pre-monsoon season only. The country was at maximum deficiency in rainfall of 62% during Winter season. Regionally, lowest negative departure (67%) observed over North West India region during winter season where ashighest positive departure of 32% was observed in South Peninsula region during Pre-Monsoon season. During SW Monsoon season, lowest rainfall deficiency (-25%) observed over East & North East India, where as maximum -2% departure observed over south peninsula and north west India region.

## **MONTHLY RAINFALL STATISTICS FOR THE COUNTRY & BROAD REGIONS**

The observed monthly rainfall for the country as a whole and also for the four broad regions of the country are given at Table4 and the % departure from normal rainfall are given at Table5. The country received maximum rainfall in the month of July as 274.1 mm and minimum in the month of February as 2.9 mm. However, on comparing with normals, it is observed that the maximum positive departure is of 4% from its normal rainfall in the month of May whereas the maximum negative departure of rainfall was of 85% in the month of January country as whole. While, looking at the regions of India, it may be observed that, maximum positive departure of 119% was recorded in Central India in the month of December, where as the maximum negative departure was of 91% in the month of January in Central India. The highest rainfall of 352.4 mm was recorded in the month of July in Central India and the least rainfall recorded was 0.0 mm in the month of January in Central India.

## **REGION-WISE DAILY RAINFALL SERIES – SW MONSOON 2018**

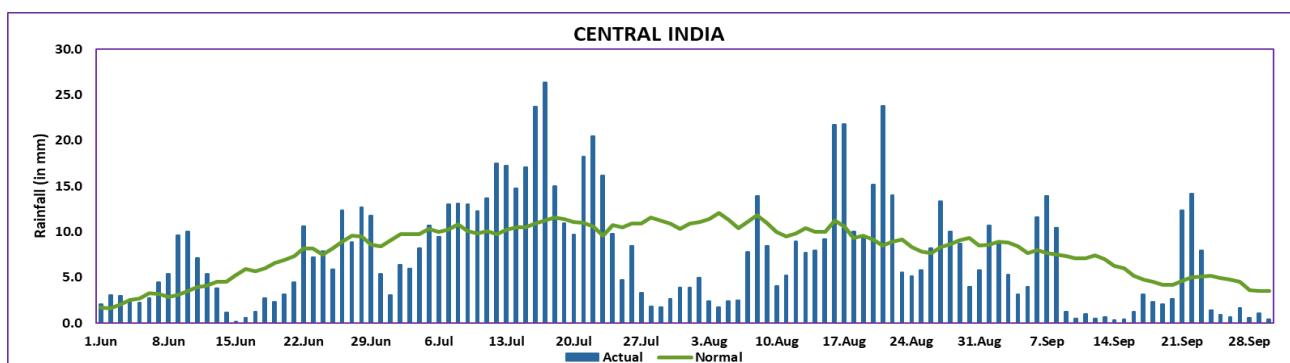

Realtime daily rainfall (in mm) and its long term (1961-2010) normal value for the country as a whole and for the four homogeneous regions during 1 June to 30 September are shown in Fig.9.6. For the country as a whole, rainfall averaged was generally below or near normal on many days during June and normal to above normal during July, August and September. The temporal distribution of SW Monsoon rainfall of the country at Figure 9.6 shows that the rainfall was good throughout the season but there were three long deficient rainfall spells of more than 10 days during 14 June to 25 June, 24 July to 11 Aug & 8 Sept. to 20 Sept for the country as a whole and also for four homogeneous regions.

### MET. SUBDIVISION-WISE SEASONAL & ANNUAL RAINFALL STATISTICS

Seasonal and annual observed rainfall statistics during the year 2018 for all the 36 Met. Subdivisions and Met. Sub divisional percent departure of rainfall has been given in Table 8 & 9. It may be observed from annual rainfall that Coastal Karnataka received highest rainfall of 3568.2 mm and West Rajasthan received lowest rainfall of 207.4 mm. During the SW Monsoon season, Coastal Karnataka received highest rainfall of 3060.2mm and West Rajasthan received lowest rainfall of 201.8 mm. On comparing the annual rainfall with normals, it may be observed that, all the Met. Subdivisions remained either in Normal or in Deficient rainfall category except for Kerala which remained in Excess category. None of the Met. Subdivisions remained in Large Deficient category. During SW Monsoon season also, no Met. Subdivision remained in Large Deficient rainfall category. During SW Monsoon season 2018 and annually, none of the 36 Met. Subdivisions recorded the rainfall that is less than 46% of its normal, with highest deficiency in rainfall of 46% and 39% in LAKSHADWEEP and RAYALASEEMA during SW Monsoon and annual respectively.

## **DISTRICT-WISE SEASONAL & ANNUAL RAINFALL STATISTICS**

The rainfall statistics for 681 districts of India was prepared during the year 2018. The districtwise observed seasonal and annual rainfall for the districts whose data are received throughout the year is given in Table 23. Also, the percent departures of observed rainfall from their normals have been given in Table 24. It may be seen that the rainfall for some of the districts are not available, which is due to non-availability of data either by sudden developments of faults in the instruments or by remote/difficult locations of the stations in the districts. Annually, the District of East Khasi Hills in Meghalaya received the highest rainfall of 5065.8 mm whereas the District Ladakh (Leh) in Jammu & Kashmir received the lowest rainfall of 75.3 mm, which resembles with the normal pattern of rainfall in India.

## CATEGORYWISE SEASONAL AND ANNUAL DISTRIBUTION OF NO. OF DISTRICTS – 2018

The categorywise seasonal and annual distribution of no. of districts of India has been given in Table 24 and a chart depicting the distribution is also given at Figure 107. It may be observed that in Monsoon and annually, more than half the districts out of the 681 districts experienced excess or normal rainfall. Annually and during Monsoon season only 3 & 12 no of districts remained in Large Deficient category of rainfallrespectvely. During Winter and Post-Monsoon, Pre-monsoon seasons more than half the districts were in Deficient/ Large Deficient/ No Rain category of rainfall.

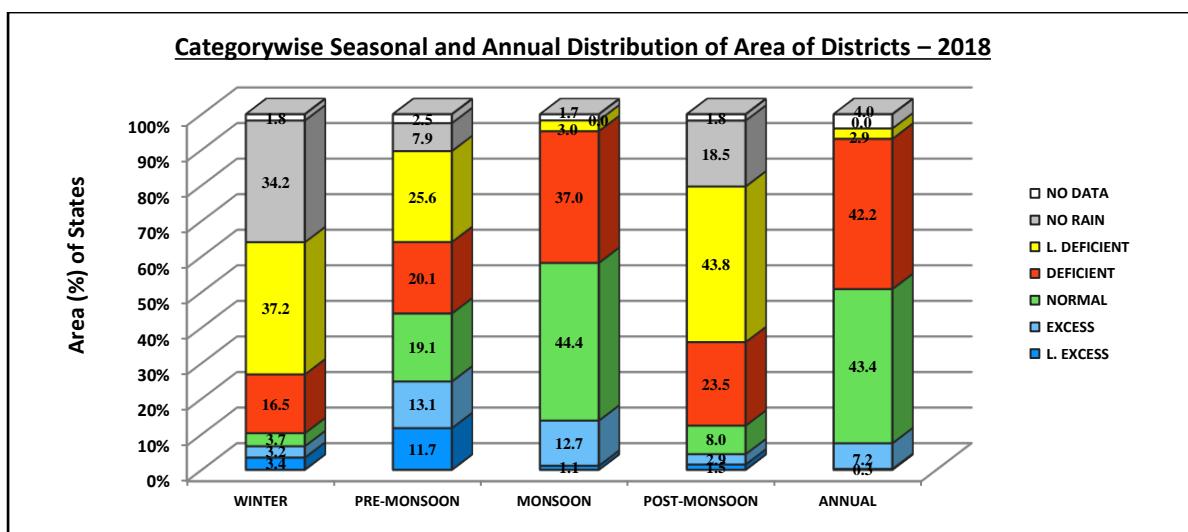

**Table 24: Category-wise Number of Districts - Seasonally and Annually - Year 2018**

CATEGORY	WINTER	PRE-MONSOON	MONSOON	POST-MONSOON	ANNUAL
L. EXCESS	18	89	12	15	3
EXCESS	19	83	100	20	59
NORMAL	24	140	289	69	296

NO RAIN	202	56	0	125	0
NO DATA	30	36	24	18	48

**Figure 107: Categorywise Seasonal and Annual Distribution of No. of Districts – 2018**

Distribution of districts of India in terms of their areas under different categories in the four seasons and for the year 2018 has been depicted in Figure 108.

**Figure 108: Category-wise distribution of Area of Districts – Seasonally and Annually – Year 2018**

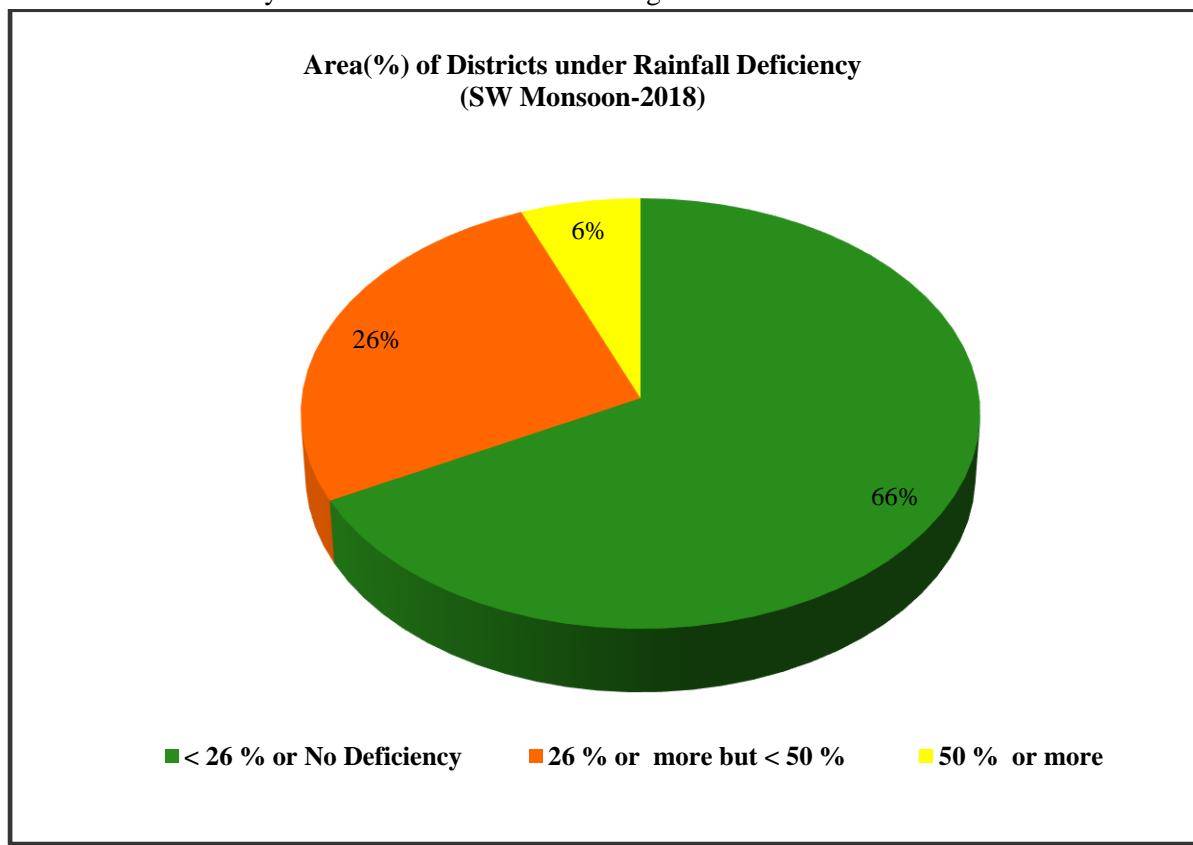

## **AREA (%) OF DISTRICTS UNDER RAINFALL DEFICIENCY – SW Monsoon 2018**

Area (%) of the districts of India during SW monsoon (June-September) under different categories of rainfall deficiency have been given below in tabular form in Table 25 and has been depicted in graphical form in Figure 108as well. Rainfall data of about 2% area of districts was not available during the SW monsoon season.

**Table 25: Area (%) of Districts of the country under Rainfall Deficiency - Monsoon 2018**

Deficiency in Rainfall	% Area of Districts of India
< 26 % or No deficiency	66%
26 % or more but < 50 %	26%
50 % or more	6%

It may be observed from Figures 12, 69 and 108 that more realistic distribution of area in different ranges of rainfall received is obtained when we consider smaller units of administrative boundaries like district than the met-subdivision or the state. In all, it may be seen that 6% area of districts of the country exhibit 50% or more deficiency in rainfall where as 66% area of districts of the country that recorded no deficiency in rainfall of 26% or less during the South-West Monsoon season.

**Figure 108: Area (%) of Districts under Rainfall Deficiency – SW Monsoon 2018**

## DISTRICT-WISE MONTHLY RAINFALL STATISTICS

The district-wise observed monthly rainfall is given in Table 27. Also, the percent departures of observed monthly rainfall from their normals have been given in Table 28. The rainfall statistics in respect of the districts whose data is not available through out the year have not been included in these tables.
